

Application Developer: Job Description for HR and Recruiters

CAM/AUTO | Mumbai | 8 October 2026

Also known as: Full-stack Developer with applied machine learning; Software Engineer (TypeScript + Python); Applied ML Engineer (tabular data)

Experience	3 to 6 years as a full-stack developer, with at least one shipped feature that used a statistical or machine-learned model
Salary	INR 18 to 28 lakh a year (pro rata for a contract), plus a completion bonus at month 5. Band is an estimate
Location	Mumbai, hybrid: at least two days a week on site
Type	Full time, or a 5-month contract with the option to convert
Priority	Third. Starts about 4 weeks after the other two hires. Please hold this search until we confirm the full budget is approved
Reports to	Founder; technical direction from the Geometry Lead

About the company

A precision CNC machine shop in Mumbai is building its own software, CAM/AUTO. The software reads a customer's 3D CAD model and drawing and writes the program that a CNC milling machine runs to cut the part. The app already works (79 releases, tested on the shop floor). We are hiring a small team to make it accurate enough for daily production and to add a feature that learns from every part cut. Three roles, one founder, one senior CNC programmer from the shop, and an AI coding assistant (Claude Code) on every desk.

The job in plain words

This person builds the screens the shop floor uses (a tablet page at the machine), the pages that show the history of every program, and the first "learning" feature of the software: it takes the measured results from each part cut and suggests better cutting settings and size corrections for the next one. This is not deep learning or AI chatbots; it is simple, well-tested statistical models on tables of numbers, with a human approving every suggestion before it is used. The role mixes web development (about 60 percent) with applied data work (about 40 percent).

What they will do day to day

- Build the shop-floor tablet page: setup card, tool list, measurement entry, tool-wear events.
- Build the per-program history page on top of the on-site database.
- Validate the Siemens CNC controller output by dry runs with the senior CNC programmer.
- Implement a roughing strategy under the Geometry Lead's design.
- Build the learning feature in Python: models that suggest speeds, feeds and size corrections from measured data, with limits, a replay test on all past parts, and an approval screen.
- Track one number: how many corrections each part needs on its first cut, quarter by quarter.

Must-have skills (screen on these)

Skill	What it means in practice	Weight
TypeScript / JavaScript	Writes it daily; comfortable building web pages with plain browser APIs, not only with React or Vue	Non-negotiable
Python for data	pandas and scikit-learn: regression, decision trees or gradient boosting; cross-validation. Has put a model into a product, not only a notebook	Non-negotiable
Backend and database	REST APIs with Node (Fastify/Express) or Python (FastAPI/Flask); PostgreSQL queries and migrations	Non-negotiable
Automated testing	Writes tests as a habit: Playwright or Cypress, Vitest or Jest, pytest	Required
Git	Daily use, pull-request reviews	Required

Good to have (not required)

- Any manufacturing, CNC or industrial software exposure; can read basic G-code or will learn.
- Basic machining knowledge: speeds and feeds, tool wear, materials.
- Experience with measurement data (CMM reports, quality data).
- XGBoost or LightGBM; model monitoring; simple MLOps.
- Tablet or kiosk user interfaces for non-office users.

Not a match (please do not send)

- Deep learning, LLM, computer vision or NLP specialists looking for research work.

- Front-end developers who have only worked inside React or Angular.
- Data analysts whose work is dashboards (Power BI, Tableau) rather than shipped code.
- Data scientists whose models stayed in notebooks.

Where to find candidates

Companies	Product start-ups with data-driven features; industrial, IoT and logistics software companies; analytics engineering teams at SaaS companies; fintech risk or pricing teams that ship tabular models
Job titles to search	Full-stack Developer, Software Engineer (Python and TypeScript), Applied ML Engineer, Machine Learning Engineer (tabular), Data Product Engineer, Analytics Engineer (with shipped code)

Screening questions HR can ask

Question	Answer to listen for
Which languages do you use daily?	TypeScript or JavaScript AND Python. Both are needed
Have you shipped a model into a product? Which library?	Yes; scikit-learn, XGBoost or LightGBM; can explain how it was tested and monitored
Have you built a web page without React or a framework?	Yes, or confident they can
Which database have you used in production?	PostgreSQL preferred; MySQL acceptable
Are you open to a 5-month contract and two days a week on a factory floor in Mumbai?	Must say yes to both

Hiring process

1. Short call with the founder (30 minutes).
2. Paid one-day practical test on real material. The candidate is paid for the day whether or not we proceed.
3. Two-hour review of the test at the shop, in front of the machine.
4. Reference calls, then an offer within a week.

Keywords

Must-have keywords (resume should show most of these)

TypeScript, JavaScript, Python, scikit-learn, pandas, regression, PostgreSQL, REST API, full-stack, Node.js

Good-to-have keywords

vanilla JavaScript, DOM, Playwright, Vitest, pytest, FastAPI, Fastify, Express, XGBoost, LightGBM, gradient boosting, tabular data, cross-validation, MLOps, model monitoring, human-in-the-loop, tablet UI, kiosk UI, manufacturing, CNC, G-code, Siemens Sinumerik, speeds and feeds, CMM

Boolean search string (LinkedIn Recruiter, Naukri)

("TypeScript" OR "JavaScript") AND "Python" AND ("scikit-learn" OR "sklearn" OR "regression" OR "XGBoost" OR "LightGBM") AND ("PostgreSQL" OR "REST")

Titles and profiles to skip

deep learning researcher, LLM engineer, computer vision engineer, NLP engineer, React Native developer, Power BI developer, Tableau developer
